

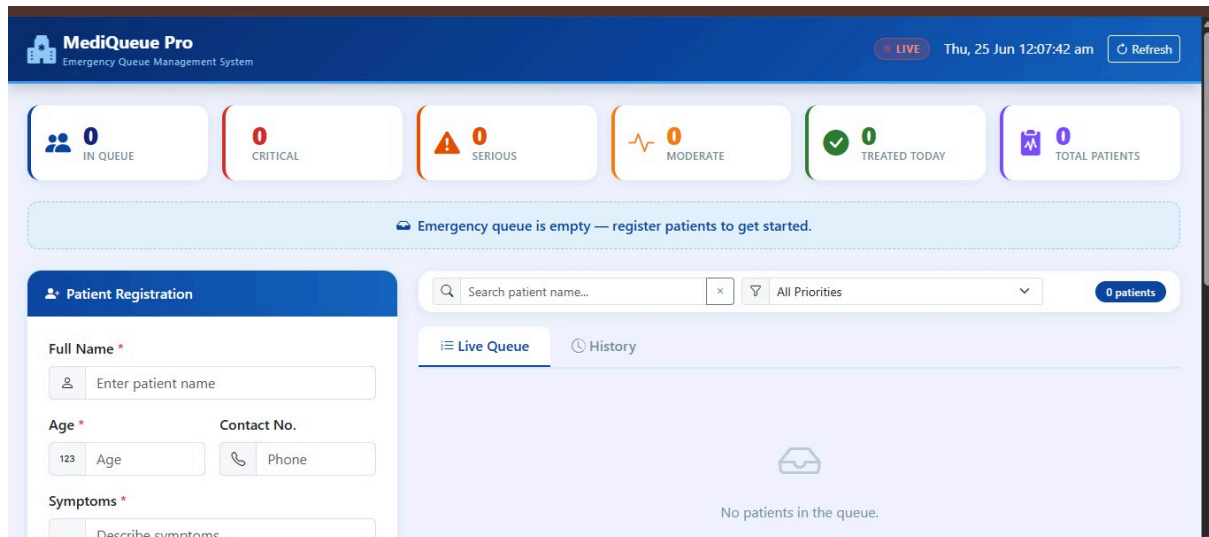

Image 1 – Initial Dashboard (Empty Queue)

Description:

The system dashboard is displayed with no patients registered. Queue statistics, live queue status, patient registration form, and priority monitoring modules are initialized and ready for operation.

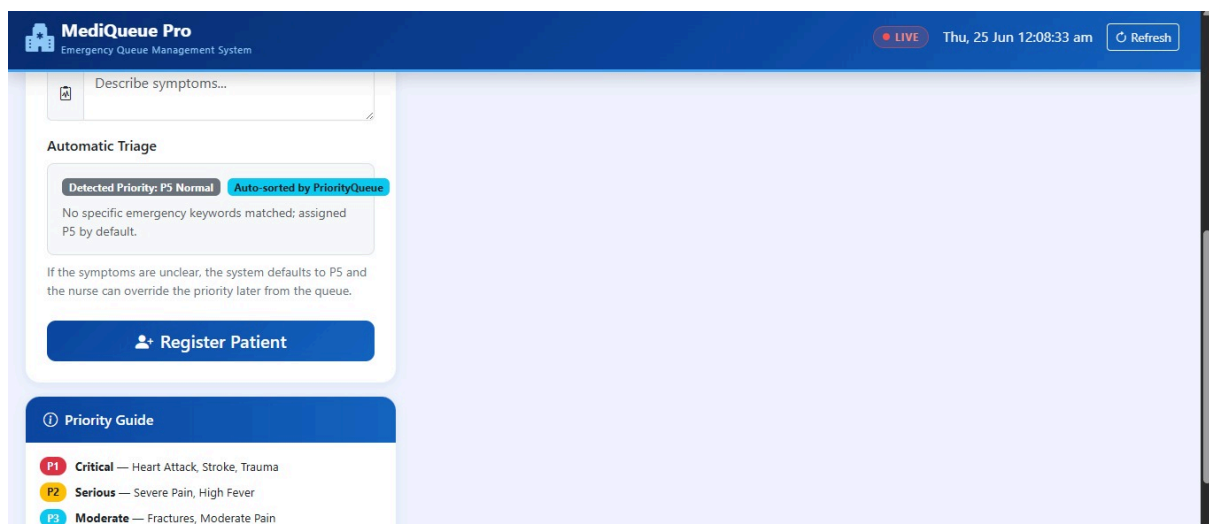

Image 2 – Automatic Triage Detection

Description:

When symptoms are entered, the system automatically analyzes keywords and assigns an emergency priority level. Patients are categorized using the Java PriorityQueue logic before registration into the emergency queue.

Image 3 – Live Emergency Queue Management

Description:

Registered patients are displayed in the live queue based on their emergency priority. Critical patients are automatically moved to the top of the queue, ensuring that high-risk cases are treated before lower-priority patients.

The screenshot displays a web-based patient registration form. At the top, there is a section titled "Symptoms *" with a red asterisk indicating a required field. Below this title is a text input box containing the text "High fever". To the left of the input box is a small icon of a person with a heart rate line. Below the input box, the section "Automatic Triage" is visible. It contains two status indicators: a yellow button labeled "Detected Priority: P2 Serious" and a blue button labeled "Auto-sorted by PriorityQueue". Below these buttons, a light gray box contains the text "Matched keywords: high fever". Further down, a paragraph of text states: "If the symptoms are unclear, the system defaults to P5 and the nurse can override the priority later from the queue." At the bottom of the form is a large blue button with a white person icon and the text "Register Patient".

Symptoms *

High fever

Automatic Triage

Detected Priority: P2 Serious Auto-sorted by PriorityQueue

Matched keywords: high fever

If the symptoms are unclear, the system defaults to P5 and the nurse can override the priority later from the queue.

Register Patient

Image 4 – Priority-Based Patient Classification

Description:

The system identifies emergency severity from patient symptoms and assigns an appropriate priority level. For example, "High Fever" is categorized as Priority 2 (Serious), and the patient is automatically positioned in the queue according to PriorityQueue sorting rules.

Use these commands from the project root:

Backend

```
cd backend
mvn spring-boot:run
```

Frontend

```
cd frontend
python -m http.server 3000
```

Then open:
